Foreword by Sir Peter Knight	v
Historical introduction	xxxii
I Basic properties of the electromagnetic field	1
1.1 The electromagnetic field	1
1.1.1 Maxwell's equations	1
1.1.2 Material equations	2
1.1.3 Boundary conditions at a surface of discontinuity	4
1.1.4 The energy law of the electromagnetic field	7
1.2 The wave equation and the velocity of light	11
1.3 Scalar waves	14
1.3.1 Plane waves	15
1.3.2 Spherical waves	16
1.3.3 Harmonic waves. The phase velocity	16
1.3.4 Wave packets. The group velocity	19
1.4 Vector waves	24
1.4.1 The general electromagnetic plane wave	24
1.4.2 The harmonic electromagnetic plane wave	25
(a) Elliptic polarization	25
(b) Linear and circular polarization	29
(c) Characterization of the state of polarization by Stokes parameters	31
1.4.3 Harmonic vector waves of arbitrary form	33
1.5 Reflection and refraction of a plane wave	38
1.5.1 The laws of reflection and refraction	38
1.5.2 Fresnel formulae	40
1.5.3 The reflectivity and transmissivity; polarization on reflection and refraction	43
1.5.4 Total reflection	49
1.6 Wave propagation in a stratified medium. Theory of dielectric films	54
1.6.1 The basic differential equations	55
1.6.2 The characteristic matrix of a stratified medium	58
(a) A homogeneous dielectric film	61
(b) A stratified medium as a pile of thin homogeneous films	62
1.6.3 The reflection and transmission coefficients	63
1.6.4 A homogeneous dielectric film	64
1.6.5 Periodically stratified media	70
II Electromagnetic potentials and polarization	75
2.1 The electrodynamic potentials in the vacuum	76

2.1.1	The vector and scalar potentials	76
2.1.2	Retarded potentials	78
2.2	Polarization and magnetization	80
2.2.1	The potentials in terms of polarization and magnetization	80
2.2.2	Hertz vectors	84
2.2.3	The field of a linear electric dipole	85
2.3	The Lorentz–Lorenz formula and elementary dispersion theory	89
2.3.1	The dielectric and magnetic susceptibilities	89
2.3.2	The effective field	90
2.3.3	The mean polarizability: the Lorentz–Lorenz formula	92
2.3.4	Elementary theory of dispersion	95
2.4	Propagation of electromagnetic waves treated by integral equations	103
2.4.1	The basic integral equation	104
2.4.2	The Ewald–Oseen extinction theorem and a rigorous derivation of the Lorentz–Lorenz formula	105
2.4.3	Refraction and reflection of a plane wave, treated with the help of the Ewald–Oseen extinction theorem	110
III	Foundations of geometrical optics	116
3.1	Approximation for very short wavelengths	116
3.1.1	Derivation of the eikonal equation	117
3.1.2	The light rays and the intensity law of geometrical optics	120
3.1.3	Propagation of the amplitude vectors	125
3.1.4	Generalizations and the limits of validity of geometrical optics	127
3.2	General properties of rays	129
3.2.1	The differential equation of light rays	129
3.2.2	The laws of refraction and reflection	132
3.2.3	Ray congruences and their focal properties	134
3.3	Other basic theorems of geometrical optics	135
3.3.1	Lagrange’s integral invariant	135
3.3.2	The principle of Fermat	136
3.3.3	The theorem of Malus and Dupin and some related theorems	139
IV	Geometrical theory of optical imaging	142
4.1	The characteristic functions of Hamilton	142
4.1.1	The point characteristic	142
4.1.2	The mixed characteristic	144
4.1.3	The angle characteristic	146
4.1.4	Approximate form of the angle characteristic of a refracting surface of revolution	147
4.1.5	Approximate form of the angle characteristic of a reflecting surface of revolution	151
4.2	Perfect imaging	152
4.2.1	General theorems	153
4.2.2	Maxwell’s ‘fish-eye’	157
4.2.3	Stigmatic imaging of surfaces	159
4.3	Projective transformation (collineation) with axial symmetry	160
4.3.1	General formulae	161
4.3.2	The telescopic case	164
4.3.3	Classification of projective transformations	165
4.3.4	Combination of projective transformations	166
4.4	Gaussian optics	167
4.4.1	Refracting surface of revolution	167

4.4.2	Reflecting surface of revolution	170
4.4.3	The thick lens	171
4.4.4	The thin lens	174
4.4.5	The general centred system	175
4.5	Stigmatic imaging with wide-angle pencils	178
4.5.1	The sine condition	179
4.5.2	The Herschel condition	180
4.6	Astigmatic pencils of rays	181
4.6.1	Focal properties of a thin pencil	181
4.6.2	Refraction of a thin pencil	182
4.7	Chromatic aberration. Dispersion by a prism	186
4.7.1	Chromatic aberration	186
4.7.2	Dispersion by a prism	190
4.8	Radiometry and apertures	193
4.8.1	Basic concepts of radiometry	194
4.8.2	Stops and pupils	199
4.8.3	Brightness and illumination of images	201
4.9	Ray tracing	204
4.9.1	Oblique meridional rays	204
4.9.2	Paraxial rays	207
4.9.3	Skew rays	208
4.10	Design of aspheric surfaces	211
4.10.1	Attainment of axial stigmatism	211
4.10.2	Attainment of aplanatism	214
4.11	Image-reconstruction from projections (computerized tomography)	217
4.11.1	Introduction	217
4.11.2	Beam propagation in an absorbing medium	218
4.11.3	Ray integrals and projections	219
4.11.4	The N -dimensional Radon transform	221
4.11.5	Reconstruction of cross-sections and the projection-slice theorem of computerized tomography	223
V	Geometrical theory of aberrations	228
5.1	Wave and ray aberrations; the aberration function	229
5.2	The perturbation eikonal of Schwarzschild	233
5.3	The primary (Seidel) aberrations	236
(a)	Spherical aberration ($B \neq 0$)	238
(b)	Coma ($F \neq 0$)	238
(c)	Astigmatism ($C \neq 0$) and curvature of field ($D \neq 0$)	240
(d)	Distortion ($E \neq 0$)	243
5.4	Addition theorem for the primary aberrations	244
5.5	The primary aberration coefficients of a general centred lens system	246
5.5.1	The Seidel formulae in terms of two paraxial rays	246
5.5.2	The Seidel formulae in terms of one paraxial ray	251
5.5.3	Petzval's theorem	253
5.6	Example: The primary aberrations of a thin lens	254
5.7	The chromatic aberration of a general centred lens system	257
VI	Image-forming instruments	261
6.1	The eye	261
6.2	The camera	263
6.3	The refracting telescope	267
6.4	The reflecting telescope	274

6.5	Instruments of illumination	279
6.6	The microscope	281
VII	Elements of the theory of interference and interferometers	286
7.1	Introduction	286
7.2	Interference of two monochromatic waves	287
7.3	Two-beam interference: division of wave-front	290
7.3.1	Young's experiment	290
7.3.2	Fresnel's mirrors and similar arrangements	292
7.3.3	Fringes with quasi-monochromatic and white light	295
7.3.4	Use of slit sources; visibility of fringes	296
7.3.5	Application to the measurement of optical path difference: the Rayleigh interferometer	299
7.3.6	Application to the measurement of angular dimensions of sources: the Michelson stellar interferometer	302
7.4	Standing waves	308
7.5	Two-beam interference: division of amplitude	313
7.5.1	Fringes with a plane-parallel plate	313
7.5.2	Fringes with thin films; the Fizeau interferometer	318
7.5.3	Localization of fringes	325
7.5.4	The Michelson interferometer	334
7.5.5	The Twyman–Green and related interferometers	336
7.5.6	Fringes with two identical plates: the Jamin interferometer and interference microscopes	341
7.5.7	The Mach–Zehnder interferometer; the Bates wave-front shearing interferometer	348
7.5.8	The coherence length; the application of two-beam interference to the study of the fine structure of spectral lines	352
7.6	Multiple-beam interference	359
7.6.1	Multiple-beam fringes with a plane-parallel plate	360
7.6.2	The Fabry–Perot interferometer	366
7.6.3	The application of the Fabry–Perot interferometer to the study of the fine structure of spectral lines	370
7.6.4	The application of the Fabry–Perot interferometer to the comparison of wavelengths	377
7.6.5	The Lummer–Gehrcke interferometer	380
7.6.6	Interference filters	386
7.6.7	Multiple-beam fringes with thin films	391
7.6.8	Multiple-beam fringes with two plane-parallel plates	401
	(a) Fringes with monochromatic and quasi-monochromatic light	401
	(b) Fringes of superposition	405
7.7	The comparison of wavelengths with the standard metre	409
VIII	Elements of the theory of diffraction	412
8.1	Introduction	412
8.2	The Huygens–Fresnel principle	413
8.3	Kirchhoff's diffraction theory	417
8.3.1	The integral theorem of Kirchhoff	417
8.3.2	Kirchhoff's diffraction theory	421
8.3.3	Fraunhofer and Fresnel diffraction	425
8.4	Transition to a scalar theory	430
8.4.1	The image field due to a monochromatic oscillator	431
8.4.2	The total image field	434

8.5	Fraunhofer diffraction at apertures of various forms	436
8.5.1	The rectangular aperture and the slit	436
8.5.2	The circular aperture	439
8.5.3	Other forms of aperture	443
8.6	Fraunhofer diffraction in optical instruments	446
8.6.1	Diffraction gratings	446
	(a) The principle of the diffraction grating	446
	(b) Types of grating	453
	(c) Grating spectrographs	458
8.6.2	Resolving power of image-forming systems	461
8.6.3	Image formation in the microscope	465
	(a) Incoherent illumination	465
	(b) Coherent illumination – Abbe's theory	467
	(c) Coherent illumination – Zernike's phase contrast method of observation	472
8.7	Fresnel diffraction at a straight edge	476
8.7.1	The diffraction integral	476
8.7.2	Fresnel's integrals	478
8.7.3	Fresnel diffraction at a straight edge	481
8.8	The three-dimensional light distribution near focus	484
8.8.1	Evaluation of the diffraction integral in terms of Lommel functions	484
8.8.2	The distribution of intensity	489
	(a) Intensity in the geometrical focal plane	490
	(b) Intensity along the axis	491
	(c) Intensity along the boundary of the geometrical shadow	491
8.8.3	The integrated intensity	492
8.8.4	The phase behaviour	494
8.9	The boundary diffraction wave	499
8.10	Gabor's method of imaging by reconstructed wave-fronts (holography)	504
8.10.1	Producing the positive hologram	504
8.10.2	The reconstruction	506
8.11	The Rayleigh–Sommerfeld diffraction integrals	512
8.11.1	The Rayleigh diffraction integrals	512
8.11.2	The Rayleigh–Sommerfeld diffraction integrals	514
IX	The diffraction theory of aberrations	517
9.1	The diffraction integral in the presence of aberrations	518
9.1.1	The diffraction integral	518
9.1.2.	The displacement theorem. Change of reference sphere	520
9.1.3.	A relation between the intensity and the average deformation of wave-fronts	522
9.2	Expansion of the aberration function	523
9.2.1	The circle polynomials of Zernike	523
9.2.2	Expansion of the aberration function	525
9.3	Tolerance conditions for primary aberrations	527
9.4	The diffraction pattern associated with a single aberration	532
9.4.1	Primary spherical aberration	536
9.4.2	Primary coma	538
9.4.3	Primary astigmatism	539
9.5	Imaging of extended objects	543
9.5.1	Coherent illumination	543
9.5.2	Incoherent illumination	547

X	Interference and diffraction with partially coherent light	554
10.1	Introduction	554
10.2	A complex representation of real polychromatic fields	557
10.3	The correlation functions of light beams	562
10.3.1	Interference of two partially coherent beams. The mutual coherence function and the complex degree of coherence	562
10.3.2	Spectral representation of mutual coherence	566
10.4	Interference and diffraction with quasi-monochromatic light	569
10.4.1	Interference with quasi-monochromatic light. The mutual intensity	569
10.4.2	Calculation of mutual intensity and degree of coherence for light from an extended incoherent quasi-monochromatic source	572
	(a) The van Cittert–Zernike theorem	572
	(b) Hopkins' formula	577
10.4.3	An example	578
10.4.4	Propagation of mutual intensity	580
10.5	Interference with broad-band light and the spectral degree of coherence. Correlation-induced spectral changes	585
10.6	Some applications	590
10.6.1	The degree of coherence in the image of an extended incoherent quasi-monochromatic source	590
10.6.2	The influence of the condenser on resolution in a microscope	595
	(a) Critical illumination	595
	(b) Köhler's illumination	598
10.6.3	Imaging with partially coherent quasi-monochromatic illumination	599
	(a) Transmission of mutual intensity through an optical system	599
	(b) Images of transilluminated objects	602
10.7	Some theorems relating to mutual coherence	606
10.7.1	Calculation of mutual coherence for light from an incoherent source	606
10.7.2	Propagation of mutual coherence	609
10.8	Rigorous theory of partial coherence	610
10.8.1	Wave equations for mutual coherence	610
10.8.2	Rigorous formulation of the propagation law for mutual coherence	612
10.8.3	The coherence time and the effective spectral width	615
10.9	Polarization properties of quasi-monochromatic light	619
10.9.1	The coherency matrix of a quasi-monochromatic plane wave	619
	(a) Completely unpolarized light (natural light)	624
	(b) Complete polarized light	624
10.9.2	Some equivalent representations. The degree of polarization of a light wave	626
10.9.3	The Stokes parameters of a quasi-monochromatic plane wave	630
XI	Rigorous diffraction theory	633
11.1	Introduction	633
11.2	Boundary conditions and surface currents	635
11.3	Diffraction by a plane screen: electromagnetic form of Babinet's principle	636
11.4	Two-dimensional diffraction by a plane screen	638
11.4.1	The scalar nature of two-dimensional electromagnetic fields	638
11.4.2	An angular spectrum of plane waves	639
11.4.3	Formulation in terms of dual integral equations	642
11.5	Two-dimensional diffraction of a plane wave by a half-plane	643
11.5.1	Solution of the dual integral equations for <i>E</i> -polarization	643
11.5.2	Expression of the solution in terms of Fresnel integrals	645
11.5.3	The nature of the solution	648

11.5.4	The solution for H -polarization	652
11.5.5	Some numerical calculations	653
11.5.6	Comparison with approximate theory and with experimental results	656
11.6	Three-dimensional diffraction of a plane wave by a half-plane	657
11.7	Diffraction of a field due to a localized source by a half-plane	659
11.7.1	A line-current parallel to the diffracting edge	659
11.7.2	A dipole	664
11.8	Other problems	667
11.8.1	Two parallel half-planes	667
11.8.2	An infinite stack of parallel, staggered half-planes	669
11.8.3	A strip	670
11.8.4	Further problems	671
11.9	Uniqueness of solution	672
XII	Diffraction of light by ultrasonic waves	674
12.1	Qualitative description of the phenomenon and summary of theories based on Maxwell's differential equations	674
12.1.1	Qualitative description of the phenomenon	674
12.1.2	Summary of theories based on Maxwell's equations	677
12.2	Diffraction of light by ultrasonic waves as treated by the integral equation method	680
12.2.1	Integral equation for E-polarization	682
12.2.2	The trial solution of the integral equation	682
12.2.3	Expressions for the amplitudes of the light waves in the diffracted and reflected spectra	686
12.2.4	Solution of the equations by a method of successive approximations	686
12.2.5	Expressions for the intensities of the first and second order lines for some special cases	689
12.2.6	Some qualitative results	691
12.2.7	The Raman–Nath approximation	693
XIII	Scattering from inhomogeneous media	695
13.1	Elements of the scalar theory of scattering	695
13.1.1	Derivation of the basic integral equation	695
13.1.2	The first-order Born approximation	699
13.1.3	Scattering from periodic potentials	703
13.1.4	Multiple scattering	708
13.2	Principles of diffraction tomography for reconstruction of the scattering potential	710
13.2.1	Angular spectrum representation of the scattered field	711
13.2.2	The basic theorem of diffraction tomography	713
13.3	The optical cross-section theorem	716
13.4	A reciprocity relation	724
13.5	The Rytov series	726
13.6	Scattering of electromagnetic waves	729
13.6.1	The integro-differential equations of electromagnetic scattering theory	729
13.6.2	The far field	730
13.6.3	The optical cross-section theorem for scattering of electromagnetic waves	732
XIV	Optics of metals	735
14.1	Wave propagation in a conductor	735

14.2	Refraction and reflection at a metal surface	739
14.3	Elementary electron theory of the optical constants of metals	749
14.4	Wave propagation in a stratified conducting medium. Theory of metallic films	752
14.4.1	An absorbing film on a transparent substrate	752
14.4.2	A transparent film on an absorbing substrate	758
14.5	Diffraction by a conducting sphere; theory of Mie	759
14.5.1	Mathematical solution of the problem	760
	(a) Representation of the field in terms of Debye's potentials	760
	(b) Series expansions for the field components	765
	(c) Summary of formulae relating to the associated Legendre functions and to the cylindrical functions	772
14.5.2	Some consequences of Mie's formulae	774
	(a) The partial waves	774
	(b) Limiting cases	775
	(c) Intensity and polarization of the scattered light	780
14.5.3	Total scattering and extinction	784
	(a) Some general considerations	784
	(b) Computational results	785
XV	Optics of crystals	790
15.1	The dielectric tensor of an anisotropic medium	790
15.2	The structure of a monochromatic plane wave in an anisotropic medium	792
15.2.1	The phase velocity and the ray velocity	792
15.2.2	Fresnel's formulae for the propagation of light in crystals	795
15.2.3	Geometrical constructions for determining the velocities of propagation and the directions of vibration	799
	(a) The ellipsoid of wave normals	799
	(b) The ray ellipsoid	802
	(c) The normal surface and the ray surface	803
15.3	Optical properties of uniaxial and biaxial crystals	805
15.3.1	The optical classification of crystals	805
15.3.2	Light propagation in uniaxial crystals	806
15.3.3	Light propagation in biaxial crystals	808
15.3.4	Refraction in crystals	811
	(a) Double refraction	811
	(b) Conical refraction	813
15.4	Measurements in crystal optics	818
15.4.1	The Nicol prism	818
15.4.2	Compensators	820
	(a) The quarter-wave plate	820
	(b) Babinet's compensator	821
	(c) Soleil's compensator	823
	(d) Berek's compensator	823
15.4.3	Interference with crystal plates	823
15.4.4	Interference figures from uniaxial crystal plates	829
15.4.5	Interference figures from biaxial crystal plates	831
15.4.6	Location of optic axes and determination of the principal refractive indices of a crystalline medium	833
15.5	Stress birefringence and form birefringence	834
15.5.1	Stress birefringence	834
15.5.2	Form birefringence	837

15.6	Absorbing crystals	840
15.6.1	Light propagation in an absorbing anisotropic medium	840
15.6.2	Interference figures from absorbing crystal plates	846
(a)	Uniaxial crystals	847
(b)	Biaxial crystals	848
15.6.3	Dichroic polarizers	849
<i>Appendices</i>		853
I	The Calculus of variations	853
1	Euler's equations as necessary conditions for an extremum	853
2	Hilbert's independence integral and the Hamilton–Jacobi equation	855
3	The field of extremals	856
4	Determination of all extremals from the solution of the Hamilton–Jacobi equation	858
5	Hamilton's canonical equations	860
6	The special case when the independent variable does not appear explicitly in the integrand	861
7	Discontinuities	862
8	Weierstrass' and Legendre's conditions (sufficiency conditions for an extremum)	864
9	Minimum of the variational integral when one end point is constrained to a surface	866
10	Jacobi's criterion for a minimum	867
11	Example I: Optics	868
12	Example II: Mechanics of material points	870
II	Light optics, electron optics and wave mechanics	873
1	The Hamiltonian analogy in elementary form	873
2	The Hamiltonian analogy in variational form	876
3	Wave mechanics of free electrons	879
4	The application of optical principles to electron optics	881
III	Asymptotic approximations to integrals	883
1	The method of steepest descent	883
2	The method of stationary phase	888
3	Double integrals	890
IV	The Dirac delta function	892
V	A mathematical lemma used in the rigorous derivation of the Lorentz–Lorenz formula (§2.4.2)	898
VI	Propagation of discontinuities in an electromagnetic field (§3.1.1)	901
1	Relations connecting discontinuous changes in field vectors	901
2	The field on a moving discontinuity surface	903
VII	The circle polynomials of Zernike (§9.2.1)	905
1	Some general considerations	905
2	Explicit expressions for the radial polynomials $R_m^{\pm m}(\rho)$	907
VIII	Proof of the inequality $\mu_{12}(\nu) \leq 1$ for the spectral degree of coherence (§10.5)	911
IX	Proof of a reciprocity inequality (§10.8.3)	912
X	Evaluation of two integrals (§12.2.2)	914
XI	Energy conservation in scalar wavefields (§13.3)	918
XII	Proof of Jones' lemma (§13.3)	921
